### Numpy Historical

- Numeric (1995)
- Numarray (for large arrays)
- scipy.core (briefly, around 2005)
- numpy (2005)

(EMBL)

## Currently

- numpy 1.6
- de facto standard
- very stable

## Basic Type

 $numpy.array\ or\ numpy.ndarray.$ 

Multi-dimensional array of numbers.

### numpy example

```
import numpy as np A = \text{np.array}([ [0,1,2], [2,3,4], [4,5,6], [6,7,8]]) print A[0,0] print A[0,1] print A[0,1] print A[1,0]
```

# Some Array Properties

```
\begin{array}{l} {\rm import\ numpy\ as\ np} \\ A = np.\, {\rm array}\,(\,[\, \\ [\,0\,,1\,,2\,]\,\,, \\ [\,2\,,3\,,4\,]\,\,, \\ [\,4\,,5\,,6\,]\,\,, \\ [\,6\,,7\,,8\,]\,]\,) \\ {\rm print\ A.\, shape} \\ {\rm print\ A.\, size} \end{array}
```

## Some Array Functions

```
print A.max()
print A.min()
 • max(): maximum
  • min(): minimum
 • ptp(): spread (max - min)
 • sum(): sum
 • std(): standard deviation
```

### Other Functions

- np.exp
- np.sin

All of these work element-wise!

## Arithmetic Operations

```
import numpy as np
A = np.array([0,1,2,3])
B = np.array([1,1,2,2])
print A + B
print A * B
print A / B
```

## Broadcasting

### Mixing arrays of different dimensions

```
import numpy as np
A = np.array([
    [0,0,1],
    [1,1,2],
    [1,2,2],
    [3, 2, 2]
B = np. array([2,1,2])
print A + B
print A * B
```

## Broadcasting

```
Special case: scalar.
```

```
import numpy as np A = np.arange(100) print A + 2 A \leftarrow 2
```

## Data Types

numpy.ndarray is a homogeneous array of numbers.

(EMBL)

### Types

- Boolean
- integers
- floating point numbers
- ..

### Object Construction

```
import numpy as np
A = np.array([0,1,1],float)
A = np.array([0,1,1],bool)
```

#### Reduction

```
A = np.array([
    [0,0,1],
     [1,2,3],
     [2,4,2],
     [1,0,1])
print A.max(0)
print A.max(1)
print A.max()
prints
[2,4,3]
[1,3,4,1]
```

The same is true for many other functions.

(EMBL)

# Slicing

```
import numpy as np A = \text{np.array}([ [0,1,2], [2,3,4], [4,5,6], [6,7,8]]) print A[0] print A[0]. shape print A[1] print A[1] print A[1,2]
```

#### Two minute break

- Talk to your neighbours
- Play around in Python
- Ask questions

(EMBL)

### Slices Share Memory!

```
import numpy as np A = np.array([[0,1,2], [2,3,4], [4,5,6], [6,7,8]]) B = A[0] B[0] = -1 print A[0,0]
```

(EMBL)

### Pass is By Reference

```
def double(A):
    A *= 2

A = np.arange(20)
double(A)
```

### Pass is By Reference

```
def double (A):
    A *= 2
A = np.arange(20)
double (A)
A = np.arange(20)
B = A. copy()
```

### Logical Arrays

$$\begin{array}{l} A = \text{np.array} \, (\, [\, \text{-}1\,, 0\,, 1\,, 2\,, \text{-}2\,, 3\,, 4\,, \text{-}2\,] \,) \\ \text{print} \ \, (A > 0) \end{array}$$

## Logical Arrays II

```
\begin{array}{l} A \, = \, \operatorname{np.array} \, ( \, [ \, \text{-} \, 1 \, , 0 \, , 1 \, , 2 \, , \text{-} \, 2 \, , 3 \, , 4 \, , \text{-} \, 2 \, ] \, ) \\ \operatorname{print} \, \left( \, (A \, > \, 0 \, ) \, \, \& \, \, (A \, < \, 3 \, ) \, \, ) \, . \, \operatorname{mean} ( \, ) \end{array}
```

What does this do?

## Logical Indexing

$$A[A < 0] = 0$$

or

$$A *= (A > 0)$$

## Logical Indexing

 $\label{eq:print_state} \mbox{print 'Mean of positives', } A[A>0].mean()$ 

## Some Helper Functions

### Constructing Arrays

```
A = np.zeros((10,10), int)

B = np.ones(10)

C = np.arange(100).reshape((10,10))
```

(EMBL)

#### Multiple Dimensions

```
img = np.zeros((1024, 1024, 3))
```

#### Documentation

 $\rm http://docs.scipy.org/doc/$ 

(EMBL)

# <u>Matplotlib</u>

Matplotlib is a plotting library for Python.

```
import pylab import numpy as np  \begin{split} X &= \text{np.linspace} \left( -4\,,\!+4\,,1000 \right) \\ \text{pylab.plot} \left( X, \text{np.exp} \left( -X^{**}2 \right) \right) \\ \text{pylab.xlabel} \left( r\,\, \$x\$\,\, ") \\ \text{pylab.ylabel} \left( r\,\, "\$ \times " \left( -x^{*}2 \right) \$\,\, ") \\ \text{pylab.savefig} \left( \, "gaussian.pdf\,\, ") \\ \text{http://matplotlib.sf.net/} \end{split}
```

# Matplotlib Example
