Python

Let's digress for a moment discussing the language...

Python Language History

### History

- Python was started in the late 80's.
- It was intended to be both easy to teach and industrial strength.
- It is (has always been) open-source.
- In the last 10 years, it has become one of the most widely used languages (top 10).

Popularity

# Popularity

Python Versions

Python Versions

- The current versions of Python are 2.7 and 3.3
- This class assumes you have 2.6–2.7
- There are some small differences when compared to version 3.x

What is a Computer?

1. Memory
2. Processor
3. Magic

Python Model

1. Objects
2. Operations on objects
3. Magic

Python Example

```python
print "Hello World"
```

Running Python

1. From a file
2. Interactively

Computer Program

helloword.py

```python
print 'Hello World'
```
Running a Program
1. Shell
2. IDE

Let me show you a demonstration...

# More Complex Example

What is 25 times 5?

More Complex Example
What is 25 times 5?

```
print 25 * 5
```

More Complex Example

```
name = 2
other = 3
yetanother = name + other
name = 5
print yetanother + name
```
Blackboard demonstration

Conditionals

```
if <condition>:
    <statement 1>
    <statement 2>
else:
    <statement 3>
```
Lists

```python
students = ['Luis','Mark','Rita']

print students[0]
print students[1]
print students[2]
```

Loops

```
students = ['Luis','Mark','Rita',...]

for st in students:
    print st
```

Example

```
values = [0.11, -0.23, -0.16, 0.18, 0.23, 0.19]

sum = 0.0
sum2 = 0.0
for v in values:
    sum = sum + v
    sum2 = sum2 + v * v

mu = sum/len(values)
mu2 = sum2/len(values)
print 'Average: {0}'.format(mu)
print 'Std Dev: {0}'.format(mu2 - mu*mu)
```

Example

```
values = [0.11, -0.23, -0.16, 0.18, 0.23, 0.19]

sum = 0.0
sum2 = 0.0
for v in values:
    sum += v
    sum2 += v * v

mu = sum/len(values)
mu2 = sum2/len(values)
print 'Average: {0}'.format(mu)
print 'Std Dev: {0}'.format(mu2 - mu*mu)
```
Example

```python
values = [0.11, -0.23, -0.16, 0.18, 0.23, 0.19]

mu = 0.0
mu2 = 0.0
for v in values:
    mu += v
    mu2 += v * v

mu /= len(values)
mu2 /= len(values)
print 'Average: {0}'.format(mu)
print 'Std Dev: {0}'.format(mu2 - mu*mu)
```

Example

```python
values = [0.11, -0.23, -0.16, 0.18, 0.23, 0.19]

mu = 0.0
mu2 = 0.0
for v in values:
    mu += v
    mu2 += v * v

mu /= len(values)
mu2 /= len(values)
print 'Average: {0}'.format(mu)
print 'Std Dev: {0}'.format(mu2 - mu*mu)
```
Adapt the code to ignore negative numbers.

Exercise

Adapt the code to ignore negative numbers.

```python
values = [0.11, -0.23, -0.16, 0.18, 0.23, 0.19]

mu = 0.0
mu2 = 0.0
n = 0.0
for v in values:
    if v >= 0.0:
        mu += v
        mu2 += v * v
        n += 1

mu /= n
mu2 /= n
print 'Average: {0}'.format(mu)
print 'Std Dev: {0}'.format(mu2 - mu*mu)
```

Loops (II)

Greatest Common Divisor (Euclid's Method)

$$\gcd(a, b) = \begin{cases} a & \text{if } b = a \\ \gcd(a - b, b) & \text{if } a > b \\ \gcd(a, b - a) & \text{o.w.} \end{cases}$$

Loops (II)

$$\gcd(a, b) = \begin{cases} a & \text{if } b = a \\ \gcd(a - b, b) & \text{if } a > b \\ \gcd(a, b - a) & \text{o.w.} \end{cases}$$

```python
a = 9344
b = 6497

while a != b:
    if a > b:
        a, b = a-b, b
    else:
        a, b = a, b-a
print a
```

For Monday

- Install Python(x,y)
  (or the equivalent on your platform)
